

RESIWALK INSPECTIONS

Field App — Complete Walk-through

Everything the inspection app does, plus a step-by-step run from a Scope Rate Card through manager approval and into a QC Turn Re-Inspect of that same property.

For: Field inspectors, managers/approvers, QC.
Works on phone, tablet, and desktop — online and offline.

1. What ResiWalk is

ResiWalk is the field inspection app for ResiHome turns and QC. Inspectors price the scope of work room-by-room, capture photo/video evidence, and let an AI review check the scope against the company turn standard before it goes to a manager for approval. It runs in any browser, installs to the home screen, and keeps working in dead zones — syncing automatically when signal returns.

- Six inspection templates grouped by category: Turn (Scope Rate Card, Turn Re-Inspect QC), PM (Community, Vacancy/Occupancy), 1099 (Leasing Agent), QC (New Construction).
- Server-authoritative pricing: the inspector enters quantities/percentages and the app computes vendor, client, and tenant costs from the live rate-card catalog + regional rates.
- Hands-free voice line-item entry, AI scope review, and one-tap finalize that generates the manager + tenant + per-vendor PDFs.

2. Signing in & the home screen

- 1 Open the app and sign in with your ResiHome email (Google sign-in).
- 2 The home screen lists every inspection. Search by address, name, or inspector at the top.
- 3 Status chips (All / Scheduled / In Progress / Pending Approval / Completed) filter the list; the Inspector and Template dropdowns narrow it further.
- 4 Tap a card to open it. Press-and-hold a card to enter multi-select and bulk-cancel inspections.

Tip: the app is installable. "Add to Home Screen" gives it an app icon and an offline shell, so it opens even with no signal.

3. Starting a Scope Rate Card

- 1 Tap "+ New Inspection".
- 2 Pick the property, confirm bed/bath, and choose the template — under the Turn section choose "Scope Rate Card".
- 3 Choose today to start immediately, or a future date to schedule and assign it.
- 4 The inspection opens to its rooms/sections. The status pill flips to "In Progress" as soon as you make your first edit.

4. Building the scope — line items

Each room is a section. Add priced line items two ways: type them, or speak them.

Adding a line by typing

- 1** Open a room and tap "+ Add Line Item".
 - 2** Search the catalog — search is fuzzy and ranked, so "paint wall" finds "Paint 1 Wall" / "Paint 2 Wall". Pick the item.
 - 3** Enter the quantity (the unit — EA/SF/LF — is shown). Set the vendor and the tenant chargeback %. Optionally edit the description or set a custom vendor cost.
 - 4** Tap Save. To keep going, just tap "+ Add Line Item" again — it finalizes the current row and opens a fresh one.
- Whole House + an SF item auto-fills the quantity with the property square footage.
 - Paint and flooring lines auto-set the tenant % from the depreciation schedule based on the tenant's months in the home (e.g. 12 months ' paint 75% / flooring 95%). Tub/shower refinish is an exception and stays 100%.
 - Costs (vendor / client / tenant) compute live as you type.

5. Voice assistant (hands-free)

Tap the microphone in the footer and just talk while you walk the home.

- Add multiple items at once, even across rooms: "add two light bulbs in the kitchen and a drywall repair in the hallway."
- Say a tenant % or vendor only if it differs from the defaults ("50 percent tenant", "assign to PPW").
- Domain-aware: "sales clean / full house clean" adds the single Whole House clean line; "mist match" is paint; it asks for a measured quantity (e.g. carpet SF) when needed instead of guessing.
- It announces each line it adds; review the proposal and keep moving.

6. Photos & video evidence

- 1** In a room, tap "Take" to open the in-app camera.
- 2** Snap a photo, press-and-hold for a video clip (capped at 20s), or use the Gallery button to pick existing photos. The phone-camera button (with the lightning badge) opens your device camera for a flash shot.
- 3** Mark up a photo (arrow / circle / pen), and tag a photo to a specific line item so it travels with that line.

Offline: photos are compressed and queued on the device, shown immediately, and upload automatically when you're back online. A storage warning appears if the device is filling up.

7. Totals & the scope breakdown

- The header shows live totals: Lines, Vendor, Client, Tenant, Net Turn.
- Tap the totals to expand a by-category breakdown; tap a category to drill into its line items. "Expand all / Collapse all" opens or closes everything at once.

8. Offline & syncing

- Everything works offline — the catalog is cached and edits/photos queue locally.
- A banner shows what's pending and "Syncing..." while it sends. If something can't sync, it flips to a red "haven't synced" with Retry, Details (the exact reason), and Clear.
- Submit is blocked until all changes have truly synced, so a manager never receives a half-saved scope.

9. AI Scope Review (required before submit)

The AI review checks the scope against the investment-property standard — SAFE, CLEAN, FUNCTIONAL — and the depreciation and tenant-responsibility rules.

- 1 Tap the AI Review icon (the spark) in the footer. Its badge shows status: amber = needed, green check = done for the current scope.
 - 2 Suggestions stream in: edit a tenant %/quantity, remove a duplicate or over-scope line, add a missing item, or move a line to the right room.
 - 3 For each, Approve or Decline. You can override the tenant % or quantity right in the popup. Photo-gap items offer "Add photo" (opens the camera, tags the line), "Remove line", or "Ignore".
 - 4 Tap Apply — the app makes the changes, they save to HubSpot, and the review is marked complete.
- What it catches: depreciation caps on paint/flooring; tenant responsibility (gutter cleaning & yard are tenant; low/0% tenant gets scrutinized); duplicate lines; whole-house paint/clean that makes per-room lines redundant; unrealistic quantities (e.g. carpet at 1 SF); and scopes beyond safe/clean/functional.
 - Any edit to the scope (add/remove/qty/tenant %/cost) requires a fresh review before submit. Changing a vendor or editing photos does NOT — the review stays complete.
 - Inspection photos are sent so the review can confirm damage and tenant %.

10. Submit for approval

- 1 When required photos are present, the scope has synced, and AI review is complete, tap "Submit for Approval".
- 2 The inspection moves to Pending Approval and is handed to the manager/approver.

11. Manager approval & finalize

- 1 The approver opens the Pending Approval inspection and reviews the scope and photos. They can run the AI review themselves (the spark icon is available here too) — it does NOT block finalizing.
 - 2 When satisfied, tap "Finalize & Generate PDFs".
 - 3 The app generates the documents and emails the completion package.
- Documents produced: Master Report, Tenant Chargeback (PDF), per-Vendor PDFs, and the Tenant Chargeback Import (xlsx) — the xlsx is listed last.
 - A finalize lock prevents two people finalizing the same inspection at once (no duplicate PDFs/emails).

12. QC Turn Re-Inspect — calling the same inspection

After the turn work is done, QC validates it against the very Scope Rate Card that was approved.

- 1** Tap "+ New Inspection" and choose, under Turn, "Turn Re-Inspect QC".
- 2** Select the property, then pick the source Scope Rate Card to validate — the approved inspection from the steps above. Its line items copy into the QC inspection.
- 3** Walk the home and mark each line Pass or Fail, capturing before/after photos as evidence of the completed work.
- 4** Finalize the QC to record the verdict (pass/fail counts) and generate its report.

This closes the loop: Scope Rate Card ' manager approval ' QC re-inspection of that exact scope — every line the vendor was paid for is verified on site.

13. Quick tips for the field

- Use voice for speed; glance at the announced line to confirm it matched.
- Tag damage photos to their line so the chargeback evidence is unambiguous.
- Run the AI review early and again after edits — it's your safety net for depreciation, duplicates, and tenant %.
- In a dead zone, keep working — watch the sync banner clear when you're back online before you submit.
